MANATOBI / ORIGINAL PRACTICE

英検準1級
リーディングトレーニング

第10回 問題冊子

リスニング・英作文を含まない部分練習 ／ 全31問

大問	問題番号	内容
1	1〜18	短文の語句空所補充
2	19〜24	長文の語句空所補充
3	25〜31	読解

使い方

・解答用紙に答えを記入してください。問題冊子には正答を載せていません。
・問題・解説はA4縦、解答用紙はA4横。白黒・片面・実際のサイズ（100%）で印刷します。
・解き終わるまでは、別冊の解答・解説を開かないでください。
・同じ問題をアプリの分野別練習でも解けます。

独自作成した英検準1級形式のリーディング第10回です。リスニング・英作文・面接は含みません。公式教材ではなく、CSE・合否換算はしません。筆記全体の公式時間をリーディングだけの時間に流用しません。外部難度校正は未実施です。

氏名：＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿

1

短文の語句空所補充
1〜4から最も適切な答えを一つ選び、解答用紙にマークしてください。

(1) To prevent speculative panic in grain markets, the ministry released emergency reserve figures to ( ) rumors of a harvest failure.

1 quibble **2** quarry **3** quell **4** quicken

(2) Although the harbor dredging plan looked straightforward on paper, unmapped sunken barges turned the schedule into a costly ( ).

1 ordeal **2** oration **3** ornament **4** outset

(3) Because neonatal incubators cannot tolerate power surges, hospital electricians installed isolation transformers to keep voltage ( ).

1 unruly **2** unwieldy **3** unwitting **4** unwavering

(4) Far from being a selfless charity drive, the conglomerate's tree-planting gala was widely dismissed as a ( ) bid to deflect pollution fines.

1 credulous **2** cynical **3** convivial **4** canonical

(5) Centuries of coal soot had darkened the cathedral's limestone gargoyles so thoroughly that laser cleaning was needed to ( ) the original pale stone.

1 undergo **2** undercut **3** uncover **4** underwrite

(6) When three independent seismic arrays recorded identical deep tremors, skeptics could no longer ( ) the volcano's reawakening as instrument noise.

1 wind down **2** wade into **3** whip up **4** write off

(7) Rather than impose a blanket fishing ban across the bay, marine biologists proposed ( ) closures limited to peak spawning weeks.

1 targeted **2** tarnished **3** tedious **4** tenuous

(8) Because medieval parchment expands and contracts with damp air, conservators house illuminated manuscripts in ( ) glass cases.

1 heretical **2** hermetic **3** heuristic **4** histrionic

1　短文の語句空所補充（続き）

---

(9) The inquiry found that siloed radio networks had (　　) coordination between municipal firefighters and coast guard helicopters.

1 thwarted　**2** thrived　**3** thatched　**4** threaded

(10) Even seasoned polar navigators treat calm summer pack ice with (　　), knowing a shift in wind can trap a hull within an hour.

1 warmth　**2** weariness　**3** wariness　**4** whimsy

(11) Although the playwright's debut drama suffered from wooden dialogue, critics praised her second work as remarkably (　　) and assured.

1 dank　**2** daft　**3** drab　**4** deft

(12) To keep dominant app stores from stifling smaller rivals, lawmakers outlawed contract terms that (　　) developers to a single payment processor.

1 temper　**2** tether　**3** totter　**4** tinker

(13) Once hailed as an effortless cure for urban congestion, widening downtown expressways often (　　) extra commuter traffic within a few years.

1 begrudges　**2** beguiles　**3** begets　**4** bereaves

(14) Because mountain rescue volunteers buy their own cold-weather gear, the town council voted to (　　) up to eighty percent of boot and jacket receipts.

1 reincarnate　**2** reimburse　**3** reinstate　**4** reiterate

(15) The pharmaceutical trial was halted early after an independent safety board flagged (　　) liver-enzyme spikes in four volunteers.

1 untoward　**2** unscathed　**3** unfeigned　**4** untold

(16) Even after retiring from bench chemistry, Professor Noda continued to (　　) promising doctoral students across three universities.

1 muster　**2** meddle　**3** malign　**4** mentor

1　短文の語句空所補充（続き）

(17) When winter gales severed the island's undersea power cable, hospital generators had to (　　) the clinic until repair ships arrived.

1 touch off　**2** tear down　**3** tide over　**4** turn in

(18) Rather than rewrite the legacy payroll software all at once, engineers chose to (　　) older modules one department at a time.

1 phase out　**2** pan out　**3** pile up　**4** put on

District Cooling Networks Under Crowded Cities

Walk past an older office block on a humid August afternoon, and thousands of individual window units and rooftop chillers blast hot exhaust straight onto baking sidewalks. Each building runs its own compressors sized for the hottest afternoon of the year, leaving expensive machinery idle or half-loaded during milder months. Beneath financial districts in Toronto, Singapore, Paris, and central Tokyo, utility engineers have built a quieter alternative: underground district cooling loops.

Instead of cooling buildings one by one, a central plant chills vast volumes of water and pumps it through insulated pipes beneath city streets to heat exchangers inside dozens of connected towers. Centralizing refrigeration unlocks efficiencies no standalone building can match. Industrial centrifugal chillers run far more efficiently than small rooftop condensers, and operators can tap natural cold sinks—deep lake water in Toronto, river water in Paris, or cold seawater—before switching on electric compressors. (19), plants freeze giant insulated tanks of ice overnight using cheap surplus wind power, then melt that ice to cool offices during peak afternoon heat.

Architects prize district loops for freeing valuable rooftop space. Eliminating bulky cooling towers lets developers top mid-rise buildings with solar panels, rainwater gardens, or shaded terraces while cutting vibration and refrigerant leaks. (20), connecting diverse buildings—hotels busy at night alongside offices busy by day—smooths overall demand across twenty-four hours.

Retrofitting insulated mains beneath century-old subways and sewers requires heavy upfront investment, so district cooling rarely suits sprawling suburbs. In dense urban cores, however, shared chilled-water grids help cities (21).

(19)

1 In vain
2 On the contrary
3 Otherwise
4 Better yet

(20)

1 Conversely
2 Moreover
3 Instead
4 Previously

(21)

1 pump boiling water onto August sidewalks at noon
2 install louder window air conditioners on every suburban house
3 slash peak electricity strain without roasting their own streets
4 shut down hotels whenever office workers go home

Why Linguists Race to Document Whistle Languages

Across steep volcanic ravines on Spain's island of La Gomera, terraced valleys in northeastern Turkey, and cloud-forest ridges in Oaxaca, Mexico, shepherds and hillside farmers have conversed across kilometer-wide canyons for centuries without shouting a single word—or using a mobile phone. Instead, they compress the pitch and rhythm of their local spoken language into piercing melodic whistles capable of carrying over wind and rushing streams.

Outsiders once mistook whistle speech for a handful of fixed code signals like railway whistles. Acoustic linguists recording fluent practitioners discovered something far richer: whistled forms are direct acoustic transformations of ordinary spoken sentences, allowing speakers to convey novel messages—such as asking a neighbor which pasture gate broke or announcing unexpected guests—across distances where shouted vowels scatter and fade. Because human ears are sharpest between one and four kilohertz, narrowing speech into that frequency band lets a whistle travel ten times farther than a shout. (22), learning to parse whistled syllables activates both hemispheres of the brain, a finding that surprised neuroscientists accustomed to left-hemisphere speech dominance.

Today, paved mountain roads and cheap cellphones have eroded the everyday necessity that sustained whistle traditions for generations. Most fully fluent whistlers in Turkey's Kuskoy valley and rural Greece are now over sixty. (23), UNESCO heritage recognition and compulsory primary-school lessons on La Gomera have shown that institutional support can keep a whistled register alive as a source of local pride.

Documenting endangered whistle systems before elder speakers pass away helps linguists (24).

(22)

1 By contrast
2 Reluctantly
3 Otherwise
4 Intriguingly

(23)

1 Even so
2 Consequently
3 For instance
4 Likewise

(24)

1 replace every rural mobile phone tower with railway whistles
2 understand the remarkable adaptability of human speech perception
3 prove that whistled languages can express only three fixed commands
4 restrict language lessons to the left hemisphere of the brain

Biofouling and Hull-Cleaning Standards in Ports

Every ocean-going cargo ship fights a hidden drag race below its waterline. Within hours of submerging in coastal water, bare hull steel acquires a slick bacterial biofilm; within weeks, barnacles, mussels, tube worms, and kelp fronds anchor tightly onto rudder blades and propeller shafts. Maritime engineers call this accumulation "biofouling," and its economic toll is immense: a thin layer of calcareous barnacles roughens hull flow enough to boost fuel consumption—and carbon dioxide emissions—by twenty to forty percent on a Pacific crossing.

For decades in the late twentieth century, shipyards solved the problem chemically by painting hulls with tributyltin (TBT), a potent biocide that leached slowly into seawater and killed attaching larvae on contact. Ecologists soon discovered, however, that TBT persisted in harbor mud and caused severe shell deformities and reproductive collapse in commercial oyster beds miles away, prompting a global treaty ban in 2008. Copper-based paints and slick silicone "foul-release" coatings replaced TBT, yet vessels idling at warm tropical anchorages still accumulate stubborn marine growth.

Today, biofouling raises a second ecological alarm: invasive species. Ships scraping hulls clean in destination ports can dislodge millions of non-native crabs, tunicates, and algae spores straight into vulnerable local bays. Several ports in New Zealand, Australia, and California now enforce strict hull-hygiene rules, requiring arriving ships either to clean hulls offshore beforehand or to deploy underwater grooming robots equipped with suction hoods that capture and filter every scraped shell fragment before water returns to the harbor.

Biofouling and Hull-Cleaning Standards in Ports — Questions

(25) How does marine biofouling penalize cargo vessels economically and environmentally during ocean voyages?

1 Rough barnacle and algae growth increases hydrodynamic drag, raising fuel burn and carbon emissions by 20–40%.

2 Barnacles dissolve steel hulls completely within forty-eight hours.

3 Kelp fronds make cargo ships float ten meters higher out of the water.

4 Clean steel hulls consume forty percent more fuel than fouled ones.

(26) Why was tributyltin (TBT) hull paint banned internationally in 2008?

1 Shipyards ran out of tin mines worldwide in 2007.

2 It attracted ten times more barnacles than unpainted steel.

3 It lingered in harbor sediments and severely harmed non-target marine life such as commercial oysters.

4 It turned ocean water bright purple around tropical ports.

(27) Why do ports in New Zealand, Australia, and California require suction-hood robots for in-port hull cleaning?

1 To pump warm tropical water into cold harbors.

2 To polish propellers into mirrors for tourist submarines.

3 To harvest barnacles for luxury harbor restaurants.

4 To capture scraped organisms and spores so non-native invasive species are not released into local waters.

Reassessing Bronze Age Tin Trade Routes

Bronze—an alloy typically blending roughly ninety percent copper with ten percent tin—gave an entire epoch of Eurasian prehistory its name, furnishing durable spearheads, plowshares, and ceremonial cauldrons from Aegean palaces to Mesopotamian city-states. Yet the raw ingredients of the Bronze Age posed a geographical puzzle that has perplexed archaeologists for over a century. Copper ore is relatively widespread across Cyprus, Anatolia, and the Levant; tin deposits, by contrast, are startlingly scarce across the eastern Mediterranean.

Where, then, did palace workshops in Mycenae, Crete, and Ugarit obtain tons of tin around 1400 BCE? Written cuneiform tablets from Assyrian merchant colonies in central Anatolia document donkey caravans hauling tin westward from Iranian plateaus centuries earlier, yet records fall silent for maritime Aegean states. Only recently have breakthroughs in lead- and tin-isotope geochemistry allowed researchers to fingerprint trace ratios preserved inside corroded bronze ingots recovered from ancient shipwrecks such as the famous Uluburun vessel off southern Turkey.

Isotope matches published over the past five years surprised specialists by pointing in two opposite compass directions at once. Roughly two-thirds of the tin ingots aboard the Uluburun ship matched high-mountain mines in Uzbekistan and Tajikistan more than three thousand kilometers east, implying relay networks linking Central Asian pastoralist miners to Mediterranean ports. The remaining ingots, however, carried chemical signatures indistinguishable from Cornwall in southwestern Britain, proving that Atlantic and riverine trade chains already reached eastern palaces by the Late Bronze Age.

Rather than depending on a single imperial monopoly, Bronze Age metallurgy evidently thrived on overlapping long-distance webs—a resilience that also explains why disruptions along so many linked routes around 1200 BCE helped bring the palace era crashing down.

Reassessing Bronze Age Tin Trade Routes — Questions

(28) What geological asymmetry made Bronze Age metallurgy a long-standing puzzle for eastern Mediterranean archaeologists?

1 Tin washed ashore on every Greek beach, whereas copper existed only in Britain.

2 Copper ore was available regionally, whereas tin deposits were extremely rare near eastern Mediterranean kingdoms.

3 Bronze required ninety percent gold imported from sub-Saharan Africa.

4 Ancient smiths did not know that bronze contained copper.

(29) How did scientists recently trace the geographic origins of tin ingots from the Uluburun shipwreck?

1 By interviewing descendants of Assyrian donkey breeders.

2 By reading English shipping labels stamped onto wooden barrels.

3 By comparing lead- and tin-isotope ratios in the ingots against ore signatures from distant mining regions.

4 By melting all surviving Mycenaean spears into modern coins.

(30) What unexpected pattern did isotope analysis reveal about the Uluburun tin cargo?

1 Every single ingot had been mined on the island of Cyprus.

2 Its tin came simultaneously from Central Asian mountain mines thousands of kilometers east and from Cornwall in Britain.

3 The ingots were actually made of painted limestone containing zero metal.

4 All tin came exclusively from South American riverbeds.

(31) What broader historical conclusion does the author draw in the final paragraph?

1 Late Bronze Age palaces relied on far-flung, overlapping trade networks whose breakdown around 1200 BCE contributed to societal collapse.

2 Central Asian pastoralists conquered Cornwall by warship in 1400 BCE.

3 Long-distance trade did not begin anywhere in Eurasia until the Roman Empire.

4 Palace workshops abandoned bronze for plastic around 1200 BCE.
