MANATOBI / ORIGINAL PRACTICE

英検準1級
リーディングトレーニング

第11回 問題冊子

リスニング・英作文を含まない部分練習 ／ 全31問

大問	問題番号	内容
1	1〜18	短文の語句空所補充
2	19〜24	長文の語句空所補充
3	25〜31	読解

使い方

・解答用紙に答えを記入してください。問題冊子には正答を載せていません。
・問題・解説はA4縦、解答用紙はA4横。白黒・片面・実際のサイズ（100%）で印刷します。
・解き終わるまでは、別冊の解答・解説を開かないでください。
・同じ問題をアプリの分野別練習でも解けます。

独自作成した英検準1級形式のリーディング第11回です。リスニング・英作文・面接は含みません。公式教材ではなく、CSE・合否換算はしません。筆記全体の公式時間をリーディングだけの時間に流用しません。外部難度校正は未実施です。

氏名：＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿

短文の語句空所補充
1〜4から最も適切な答えを一つ選び、解答用紙にマークしてください。

(1) Rather than clarify the central bank's rate path, the governor's hedged remarks left bond traders more ( ) than before.

1 placated **2** pampered **3** pilfered **4** perplexed

(2) Because granite bedrock lies just centimeters beneath the island's thin topsoil, rainwater runs off rapidly instead of ( ) into deep aquifers.

1 perjuring **2** percolating **3** perpetrating **4** personifying

(3) The antitrust consent decree required the rail operator to ( ) three regional freight terminals so competitors could bid fairly.

1 digress **2** divulge **3** divest **4** dilate

(4) Far from being an overnight breakthrough, mRNA vaccines rested on three decades of ( ) laboratory work that few funders initially backed.

1 painstaking **2** palatable **3** partisan **4** plausible

(5) When salt marsh grasses are bulldozed for coastal parking lots, shoreline towns lose a natural buffer that once ( ) storm surges.

1 conjured **2** curdled **3** coddled **4** cushioned

(6) Although the museum director called the loan dispute a minor misunderstanding, leaked letters revealed deep mutual ( ) between the two boards.

1 acrimony **2** acumen **3** affinity **4** alacrity

(7) To ensure clinical trial volunteers truly understand experimental risks, hospitals forbid consent forms written in dense legal ( ).

1 jaunt **2** jargon **3** jeopardy **4** jubilee

(8) Because copper thieves had targeted remote railway substations twice that spring, engineers enclosed spare cable reels inside ( ) steel cages.

1 top-heavy **2** threadbare **3** tamper-proof **4** time-worn

1　短文の語句空所補充（続き）

---

(9) Only after cross-examining the supplier's shipping invoices did auditors spot the (　　) billing entries hidden across twelve subsidiaries.

1 spotless　**2** spurious　**3** sprightly　**4** stalwart

(10) While flashy humanoid robots grab television airtime, plain warehouse sorting arms quietly account for the (　　) of factory automation sales.

1 loose end　**2** last straw　**3** long shot　**4** lion's share

(11) Unchecked ivy growth on historic brick walls can pry mortar joints apart, gradually rendering whole garden parapets structurally (　　).

1 unsound　**2** unscathed　**3** unassuming　**4** unwavering

(12) To prevent one failed sensor from grounding an airliner unnecessarily, flight computers compare three independent pitot tubes and (　　) any lone outlier.

1 disperse　**2** disclose　**3** discard　**4** distill

(13) Although the novelist's early essays bristled with polemical heat, his memoir strikes a noticeably more (　　) and forgiving tone.

1 morose　**2** mendacious　**3** mercenary　**4** mellow

(14) Because desert solar panels lose output whenever fine dust coats their glass, operators schedule dry robotic brushes to (　　) water scarce in arid basins.

1 conscript　**2** confiscate　**3** conserve　**4** contravene

(15) The appellate panel overturned the zoning permit, ruling that town councilors had given only (　　) consideration to landslide hazard maps.

1 torrid　**2** token　**3** tactile　**4** turgid

(16) Even well-crafted international treaties can (　　) if signatory states refuse to fund independent inspection teams.

1 founder　**2** foster　**3** furbish　**4** ferment

1　短文の語句空所補充（続き）

(17) When glass vials cracked during ultra-cold vaccine transport, materials scientists had to (　　) the thermal expansion mismatch between stopper and neck.

1 drum up　**2** egg on　**3** fend off　**4** iron out

(18) Rather than build a brand-new concert hall on farmland, the municipality chose to (　　) a vacant nineteenth-century brick textile mill.

1 repudiate　**2** repurpose　**3** reprimand　**4** replenish

2

1〜4から最も適切な答えを一つ選び、解答用紙にマークしてください。

Why Deep-Sea Fiber-Optic Cables Double as Seismometers

Mention global internet traffic, and people talk of "the cloud," imagining data floating effortlessly between satellites overhead. In reality, more than ninety-eight percent of intercontinental emails, financial trades, and video calls race along hair-thin glass fibers resting on the ocean floor. Yet those million-kilometer submarine cables traverse the seventy percent of Earth's surface where geophysicists have almost no permanent earthquake sensors—leaving blind spots around mid-ocean ridges and offshore subduction trenches.

Over the past few years, optical physicists and seismologists have turned existing telecom fibers into vast underwater listening arrays without laying a single new seafloor instrument. Using a technique called Distributed Acoustic Sensing (DAS), researchers attach an interrogator box to an unused "dark fiber" strand inside a coastal landing station and fire rapid laser pulses down the glass core. Microscopic imperfections in quartz glass scatter a tiny fraction of light backward; whenever a passing seismic wave—or even an ocean swell or blue whale call—stretches the cable by nanometers, the phase of that returning light shifts measurably. (19), a single hundred-kilometer coastal cable can behave like ten thousand virtual seismometers spaced ten meters apart.

Other methods monitor tiny polarization changes across transoceanic live traffic fibers without interrupting commercial data at all. Early trials off Japan, Chile, and California have pinpointed offshore fault ruptures seconds faster than land-based stations alone, offering precious extra warning before destructive shaking or tsunamis reach coastal cities. (20), continuous seafloor strain records reveal deep ocean currents that climate models previously had to guess.

Repurposing commercial telecom infrastructure for Earth science illustrates how clever signal processing can (21).

(19)

1 Otherwise
2 On the contrary
3 In effect
4 In vain

(20)

1 Beyond hazard warning
2 Conversely
3 Instead of lasers
4 Reluctantly

(21)

1 cut transoceanic email speeds in half during whale migrations
2 replace all submarine internet fibers with communication satellites
3 stop tectonic plates from moving beneath the Pacific Ocean
4 illuminate Earth's largest blind spot using hardware already on the seabed

Rethinking Museum Repatriation and Digital Twins

For generations, debates over contested antiquities—from West African bronzes and Mediterranean marbles to Indigenous ceremonial masks—were framed as a stark zero-sum tug-of-war. Encyclopedic museums in Europe and North America argued that keeping artifacts in major metropolitan galleries preserved fragile works under climate control while allowing millions of international visitors to compare world cultures side by side. Source nations and descendant communities countered that objects seized during colonial expeditions or looted from shrines belonged back in the societies that created them.

Over the past decade, two shifts have begun breaking this stalemate. First, provenance researchers combing nineteenth-century military diaries and auction ledgers have documented coercive acquisitions in detail, leading museums in Germany, the Netherlands, France, and the United States to transfer legal ownership of hundreds of works back to countries of origin. Second, sub-millimeter 3D laser scanning and photogrammetry now allow conservators to capture surface tool marks, pigment traces, and internal geometry with extraordinary fidelity. (22), high-resolution "digital twins" and museum-grade physical casts can remain on educational display or circulate globally for scholarly study after an original artifact goes home.

Digital replicas are no substitute for returning a sacred original when theft is clear; communities rightly reject offers of a 3D file in lieu of their own heritage. Used after legal restitution is agreed, however, shared digital archives and joint conservation fellowships turn one-time handovers into lasting scientific partnerships. (23), newly built regional museums in Benin City, Cairo, and Lima now match or surpass older European halls in environmental control.

Combining ethical restitution with open digital scholarship allows museums everywhere to (24).

(22)

1 As a result
2 On the contrary
3 Otherwise
4 In vain

(23)

1 Conversely
2 At the same time
3 Otherwise
4 In secret

(24)

1 destroy all nineteenth-century auction ledgers and conservation labs
2 keep looted originals locked in European vaults while mailing postcards abroad
3 redress historical injustices without severing global public access to knowledge
4 ban international visitors from viewing ancient sculptures anywhere

3 長文の内容一致選択
1〜4から最も適切な答えを一つ選び、解答用紙にマークしてください。

How Mycorrhizal Fungi Regulate Forest Carbon

Walk through a temperate oak or pine woodland, and the visible competition happens overhead as tree crowns angle for sunlight. Beneath the leaf litter, however, nearly ninety percent of land plants engage in an ancient underground trade with mycorrhizal fungi—microscopic thread-like networks, or hyphae, that wrap around or penetrate fine root tips. Because fungal filaments are far thinner than the finest plant rootlet, they pry into tiny soil pores to mine phosphorus and nitrogen, trading those scarce minerals to trees in return for liquid sugars manufactured via photosynthesis.

Ecologists long viewed fungi as passive plumbing pipes, yet tracer-isotope experiments reveal that both partners negotiate like shrewd market traders. Using stable carbon-13 and phosphorus-33 labels in laboratory root chambers, biologists observed fungal networks routing extra phosphorus preferentially to roots offering richer sugar rewards—and even hoarding minerals temporarily near nutrient-poor patches until host plants increased carbon payments. Different fungal guilds also shape soil carbon storage differently: ectomycorrhizal fungi associated with pines, oaks, and birches secrete enzymes that strip nitrogen directly from fallen leaves, leaving behind slow-decaying organic compounds that lock carbon into forest soils for decades.

Unfortunately, heavy nitrogen deposition from highway exhaust and agricultural fertilizer disrupts this subterranean economy. Saturated with free surface nitrogen, trees cut sugar shipments to their fungal partners, starving sensitive ectomycorrhizal species and shifting forests toward fast-cycling microbes that release more soil carbon back into the atmosphere. Protecting forest carbon sinks therefore requires looking well below the tree line.

How Mycorrhizal Fungi Regulate Forest Carbon — Questions

(25) Why can mycorrhizal hyphae extract soil phosphorus and nitrogen more effectively than tree roots alone?

1 They fly up into tree canopies to catch rainwater.

2 Their microscopic filaments are much thinner than fine roots and can reach inside tiny soil pores.

3 They manufacture sugars directly from underground darkness.

4 They dissolve solid granite boulders within minutes.

(26) What did isotope-tracer experiments reveal about the relationship between host plants and mycorrhizal fungi?

1 Ectomycorrhizal fungi release all soil carbon into the air within hours.

2 Fungi act purely as lifeless plastic tubes with no control over nutrient flow.

3 Trees give fungi phosphorus in exchange for sunlight.

4 Fungi actively allocate more minerals to root zones that supply higher sugar rewards.

(27) How does heavy nitrogen pollution from traffic and fertilizer weaken forest soil carbon storage?

1 Trees supplied with easy nitrogen reduce sugar payments to ectomycorrhizal fungi, favoring microbes that release more carbon.

2 Nitrogen freezes tree trunks solid during summer.

3 Exhaust fumes turn pine needles into pure phosphorus.

4 Fertilizer causes oaks to stop performing photosynthesis altogether.

Why Early Streetlights Sparked Debates Over Nightlife

Today, municipal street lighting feels as politically neutral as storm drains or curb stones—an unquestioned civic good equated with public safety. When European capitals first mounted oil reflector lamps and coal-gas lanterns systematically between the seventeenth and early nineteenth centuries, however, public illumination was hotly contested by royal police, guild artisans, night watchmen, and neighborhood residents alike.

Early state-sponsored streetlamps in Louis XIV's Paris and eighteenth-century Vienna were installed not primarily to help pedestrians avoid puddles, but to extend sovereign surveillance into hours long governed by custom and neighborhood self-policing. Before fixed lanterns, anyone walking abroad after curfew had to carry a hand lantern, making their presence—and social rank—immediately visible; unlit alleys belonged to local apprentices and tavern-goers who deeply resented police patrols peering into courtyards. Smashings of newly hung glass lanterns became so frequent in Paris, Berlin, and London that authorities made "lantern-breaking" a severely punished offense, and crowds toppled royal streetlamps symbolically during revolutionary uprisings in 1789 and 1830.

Commercial gas lighting in the 1810s and 1820s reshaped urban rhythms just as profoundly as policing. Brightly lit shopping arcades, theaters, and cafés pushed middle-class leisure hours toward midnight, blurring the preindustrial boundary that had reserved darkness for rest and prayer. Physicians worried that glare strained human eyesight, while labor reformers noted that gas-lit textile mills could now run exhausting night shifts year-round.

Recognizing how fiercely earlier generations debated artificial light reminds historians that infrastructure rarely arrives as neutral hardware; every new network quietly renegotiates who controls public space and time.

Why Early Streetlights Sparked Debates Over Nightlife — Questions

(28) What was a primary motive behind early state-installed streetlamps in cities like Louis XIV's Paris?

1 Replacing factory shifts with mandatory twelve-hour sleep.

2 Helping solar panels generate electricity after sunset.

3 Extending police oversight and royal authority into nighttime streets.

4 Encouraging apprentices to smash old glass bottles.

(29) Why did crowds sometimes smash streetlamps during eighteenth- and nineteenth-century urban unrest?

1 Residents preferred blinding electric floodlights instead.

2 Oil lamps smelled like expensive French perfume.

3 Night watchmen paid citizens gold coins for broken glass.

4 Fixed lanterns were widely seen as symbols of state surveillance and policing.

(30) What dual social impact accompanied commercial gas lighting in the early nineteenth century?

1 It cured eyesight strain across London and Berlin.

2 It closed all cafés at sunset and shortened textile mill hours.

3 It expanded evening shopping and entertainment while also enabling grueling factory night shifts.

4 It abolished curfews only in rural farming villages.

(31) What overarching lesson do historians draw from early conflicts over street lighting?

1 Every civic technology is welcomed unanimously on the day it debuts.

2 New infrastructure is rarely neutral; it reshapes power over public space and daily time.

3 Storm drains and curb stones caused the French Revolution of 1789.

4 Cities functioned more safely when hand lanterns were illegal.
