MANATOBI / ORIGINAL PRACTICE

英検準2級プラス
リーディングトレーニング

第6回 問題冊子

リスニング・英作文を含まない部分練習 ／ 全31問

大問	問題番号	内容
1	1〜17	短文の語句空所補充
2	18〜23	長文の語句空所補充
3	24〜31	読解

使い方

・解答用紙に答えを記入してください。問題冊子には正答を載せていません。
・問題・解説はA4縦、解答用紙はA4横。白黒・片面・実際のサイズ（100%）で印刷します。
・解き終わるまでは、別冊の解答・解説を開かないでください。
・同じ問題をアプリの分野別練習でも解けます。

独自作成した英検準2級プラス形式のリーディング第6回です。リスニング・英作文・面接は含みません。公式教材ではなく、CSE・合否換算はしません。筆記全体の公式時間をリーディングだけの時間に流用しません。外部難度校正は未実施です。

氏名：＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿

短文の語句空所補充
1〜4から最も適切な答えを一つ選び、解答用紙にマークしてください。

(1) The ferry company agreed to ( ) passengers in full when typhoon winds canceled all weekend sailings.

1 reinforce **2** rehearse **3** resemble **4** reimburse

(2) Even a thin layer of dust on solar panels can ( ) their power output during dry autumn weeks.

1 distribute **2** diminish **3** distinguish **4** dismiss

(3) Because both conference rooms were booked, we held an impromptu meeting in the lobby on the ( ) of the moment.

1 span **2** spot **3** spur **4** stem

(4) The architect chose cedar boards from a nearby valley so the new station would blend ( ) with the surrounding hills.

1 harmoniously **2** hesitantly **3** hastily **4** harshly

(5) Applicants for the lifeguard course must demonstrate that they are ( ) of swimming four hundred meters nonstop.

1 convinced **2** conscious **3** composed **4** capable

1　短文の語句空所補充（続き）

---

(6) The town archive keeps original maps in dark drawers because paper ink is (　　) to fading under ultraviolet light.

1 vulnerable　**2** voluntary　**3** valuable　**4** versatile

(7) When the projector lamp burned out mid-lecture, Professor Sato carried (　　) calmly using chalk on the blackboard.

1 out　**2** on　**3** off　**4** over

(8) The two pottery kilns operate on alternating days so that peak electricity demand does not (　　) the workshop's limit.

1 exhale　**2** exclude　**3** exceed　**4** excuse

(9) Although Ms. Hori retired from full-time nursing last spring, she still helps at the vaccination clinic on a voluntary (　　).

1 balance　**2** basis　**3** border　**4** branch

(10) Not until the scaffolding came down in October (　　) residents see the bright copper roof of the restored hall.

1 have　**2** had　**3** were　**4** could

1　短文の語句空所補充（続き）

(11) We brought a printed road map as a backup, (　　) mobile phone signals were weak in the valley.

1 in case　**2** as far as　**3** even though　**4** by the time

(12) The new bicycle lights recharge via a USB cable, doing (　　) with the need for disposable batteries.

1 over　**2** up　**3** away　**4** out

(13) Several shop owners expressed (　　) that roadwork in December might keep holiday shoppers away.

1 contrast　**2** comfort　**3** consent　**4** concern

(14) The two dictionaries differ slightly (　　) how they explain regional idioms.

1 at　**2** of　**3** in　**4** by

(15) Before freezing cooked rice, wrap each portion tightly so moisture cannot (　　).

1 establish　**2** escape　**3** estimate　**4** evaluate

1　短文の語句空所補充（続き）

---

(16) The city orchestra's outdoor rehearsal drew a crowd, (　　) to the delight of families strolling by the river.

1 much　**2** many　**3** far　**4** well

(17) All protective helmets used by the climbing club are inspected annually to ensure they conform (　　) national standards.

1 for　**2** of　**3** at　**4** to

Why Libraries Lend Musical Instruments and Tools

Public libraries built their reputation on lending books, magazines, and music recordings. Over the past decade, however, hundreds of municipal libraries have added an unexpected shelf near the circulation desk—a "library of things" stocked with sewing machines, ukuleles, stargazing telescopes, and household tool kits.

The idea addresses a practical pattern of modern living. Many apartment dwellers want to mend a torn curtain once a year, test whether a child enjoys playing an instrument before buying one, or observe a lunar eclipse on a single clear evening. Buying, storing, and maintaining specialized equipment for occasional use strains both family budgets and closet space. (18), sharing sturdy items across a neighborhood keeps dozens of rarely used machines from gathering dust.

Running such a collection takes planning, of course. Librarians work with local repair volunteers to check returned drills and tune stringed instruments between loans, and borrowers sign a brief safety checklist. Surprisingly, damage rates have stayed low; patrons treat shared equipment with care because (19).

Beyond saving money, tool and instrument lending has brought new faces through library doors. Hands-on items show that a public library is ultimately dedicated to (20), whatever form learning happens to take.

(18)

1 Otherwise
2 By contrast
3 On the contrary
4 Nevertheless

(19)

1 overdue fines cost more than a new house
2 no one is allowed to take borrowed items outside the building
3 they know neighbors are waiting to use the same item next
4 libraries throw away every ukulele after one week

(20)

1 opening access to knowledge and skills in any medium
2 competing with hardware stores on cement sales
3 replacing all printed novels with power drills
4 limiting library cards to professional musicians

How Ferries Cut Fuel Use with Wind Rotor Sails

When people picture wind-powered ships, they usually imagine canvas sails billowing from wooden masts. Modern car ferries and cargo vessels look nothing like nineteenth-century clippers, yet a growing number now carry tall, spinning white cylinders on their decks to capture wind energy alongside regular engines.

These cylinders, known as rotor sails, rely on a physical principle familiar to baseball pitchers and tennis players. When a motor spins the vertical cylinder slowly in a crosswind, air speeds up on one side of the drum and slows down on the other. The resulting pressure difference pushes the ship forward at right angles to the wind. Because the motor spinning the cylinder uses only a tiny fraction of the thrust generated, ferries crossing windy straits can throttle back their main diesel engines. (21), operators on North Sea routes have recorded fuel savings of eight to fifteen percent.

Unlike fabric sails, rotor cylinders require no extra deck crew to hoist or fold when squalls hit; bridge computers adjust rotation speed automatically as wind direction changes. (22), some designs tilt flat onto the deck at the push of a button so the ship can pass safely beneath low harbor bridges.

Rotor sails cannot power a heavy ferry on calm days, nor are they meant to work alone. Rather, combining aerodynamic physics with modern automation gives shipping lines (23) while cleaner fuels are still scaling up.

(21)

1 Even so
2 By comparison
3 Otherwise
4 In fact

(22)

1 Moreover
2 Previously
3 Otherwise
4 Instead

(23)

1 a reason to rebuild every ferry out of timber and canvas
2 a practical way to cut emissions right now on existing ships
3 an excuse to avoid windy straits all year
4 a method for sailing across dry land

Instructions for the Saturday Wetland Bird Count

From: M. Kurata, Bird Conservation Group
To: Student Survey Volunteers
Subject: Observation points and quiet-zone rules for Saturday

Dear student volunteers,
Thank you for joining our winter waterfowl count at Ashihara Marsh this Saturday morning. Migratory ducks and wild geese feed near the reed beds soon after sunrise, so we will meet at the south parking shelter at 6:40 a.m. and walk to our four wooden hides in small groups.

Each group includes an experienced spotter with a high-powered scope; your job is to record species counts every fifteen minutes on the waterproof clipboards provided. Please switch your phones to silent mode and turn screen brightness all the way down before entering a hide, as sudden flashes of white light through the viewing slots can startle resting flocks.

Because two hides stand over shallow water, icy breezes come up through the floorboards. Wear wool socks—two thin pairs trap more warmth than one tight thick pair—and bring a thermos of warm drink if you like, though strongly scented soup should wait until we return to the shelter at 9:30 a.m.

Best regards,
M. Kurata

Instructions for the Saturday Wetland Bird Count — Questions

(24) What will be the student volunteers' main task inside the wooden hides?

1 Building new wooden floorboards over shallow water.

2 Taking flash photographs of migratory geese.

3 Recording bird counts every fifteen minutes on waterproof clipboards.

4 Cooking hot soup for the experienced spotters.

(25) Why must students lower their phone screen brightness completely before entering a hide?

1 Bright screens drain phone batteries faster in cold air.

2 Light shining through viewing slots can frighten resting flocks of birds.

3 The waterproof clipboards glow in the dark.

4 Spotters cannot hear bird calls when screens are bright.

(26) Why does Mr. Kurata recommend wearing wool socks in layers?

1 Students must walk barefoot through Ashihara Marsh.

2 Wool socks make footsteps louder on wooden stairs.

3 Thick boots are banned inside the south parking shelter.

4 Cold wind rises through the floorboards of hides standing over water.

Why Cities Are Uncovering Buried Streams

Beneath the asphalt of almost every major city flow dozens of forgotten brooks and small rivers. During periods of rapid urban growth in the nineteenth and twentieth centuries, engineers routinely encased neighborhood streams in underground concrete pipes—known as culverts—to gain flat land for roads, prevent rubbish dumping, and move rainwater out of town as fast as possible. Out of sight, these waterways vanished from maps and local memory alike.

Climate pressures and aging pipes are now prompting municipalities to reverse course through a practice called "daylighting"—lifting buried streams back into open air. Ironically, the old concrete channels designed to prevent localized puddles often worsen flooding downstream during intense modern cloudbursts. Smooth underground pipes shoot storm runoff forward all at once, overwhelming river junctions below. An open channel lined with stones, curves, and terraced banks slows the water down and gives high flows safe room to spread.

Bringing water back to the surface transforms urban neighborhoods in quieter months as well. Shaded streamside paths run several degrees cooler than surrounding streets on August afternoons, while riffles oxygenate the water enough for dragonflies, minnows, and herons to return within a remarkably short time. Shopkeepers along famous daylighting projects—from Seoul to Zurich—have seen foot traffic rise as once-noisy traffic lanes become pleasant places to linger.

Daylighting is not feasible everywhere, of course. Where apartment blocks or subway tunnels sit directly atop a culvert, rerouting the stream through an adjacent park strip or widening parallel greenways may be the only practical option, and upstream street runoff must be filtered through gravel beds before entering the open brook.

Even modest stretches of uncovered water remind residents that a city is built atop living geography rather than a blank concrete slab.

Why Cities Are Uncovering Buried Streams — Questions

(27) Why did nineteenth- and twentieth-century engineers bury neighborhood streams in underground pipes?

1 To create flat road space, stop trash dumping, and drain rainwater away rapidly.

2 To protect rare fish from winter snow.

3 Because residents disliked the sound of birds near parks.

4 To supply warm water to subway stations.

(28) Why can smooth underground culverts actually make modern flooding worse downstream?

1 Fish block the concrete pipes during cloudbursts.

2 They absorb too much rainwater into dry soil.

3 They send storm runoff rushing downstream all at once without slowing it.

4 They evaporate water into clouds above the city.

(29) Which everyday benefit of uncovered urban streams is mentioned in the third paragraph?

1 They allow cars to drive twice as fast through shopping districts.

2 They freeze solid in August so children can skate.

3 They eliminate the need for bridges anywhere in the city.

4 They cool nearby paths in summer, restore wildlife, and attract more pedestrians.

(30) What practical step is needed before street rainwater enters a newly opened stream?

1 Heating the water to thirty degrees Celsius.

2 Adding blue dye so tourists can see the water.

3 Filtering upstream road runoff through gravel beds.

4 Demolishing every subway tunnel in the district.

(31) What broader idea do uncovered stretches of water communicate to city residents?

1 Cities have no connection to the natural land beneath them.

2 Even dense cities rest upon living geography that can work with nature.

3 Concrete pipes are always superior to stone-lined banks.

4 Only cities without winters can maintain open waterways.
