第7回　｜　部分演習（筆記全体の制限時間は流用しません）　｜　選択問題 31問

■ 出題構成・自己採点記録表

大問	問題番号	出題形式・内容	設問数	自己採点・点検
1	(1)〜(18)	短文の語句空所補充	18問	／18
2	(19)〜(24)	長文の語句空所補充	6問	／6
3	(25)〜(31)	長文の内容一致選択	7問	／7

■ 演習・印刷の手引き

1. 問題冊子には正答や解説を載せていません。解答用紙はA4横マークシート（1ページ）です。
2. 印刷時は「白黒・実際のサイズ（100%）」を選ぶと、マーク欄や英作文罫線が本番見本に近い実寸で出力されます。
3. 解き終わるまでは「解答・解説」を開かず、本番と同じ時間配分を意識して取り組んでください。
4. 同じ選択問題はアプリの「分野別練習」、英作文課題はアプリの「ライティング練習」でも学習・保存できます。

※ 本冊子はマナトビが独自に執筆・編集した英検準1級形式のオリジナル教材（第7回）です。リスニング・二次面接は含みません。日本英語検定協会の公式過去問・公式予想問題ではなく、CSEスコア算出や合否判定は行いません。外部機関による難度校正は未実施です。

1

次の(1)から(18)までの（ ）に入れるのに最も適切なものを1, 2, 3, 4の中から一つ選び、その番号のマーク欄をぬりつぶしなさい。

(1) The maritime board warned that ignoring hairline hull fractures would ( ) the ferry's structural safety in winter swells.

1 jubilate **2** juxtapose **3** jeopardize **4** justify

(2) Although the mayor praised the stadium plan as bold, fiscal auditors called its ticket-revenue assumptions wildly ( ).

1 sanguine **2** somber **3** stringent **4** sullen

(3) To prevent flash floods from overwhelming old brick sewers, the district dug sunken park lawns that temporarily ( ) storm runoff.

1 abrogate **2** alienate **3** admonish **4** attenuate

(4) Only through ( ) cross-checking of ship logs and customs ledgers did the historian uncover the smuggling route.

1 fallacious **2** fastidious **3** facetious **4** fortuitous

(5) Rather than calm nervous depositors, the bank president's evasive press briefing served only to ( ) rumors of insolvency.

1 forfeit **2** forestall **3** foment **4** forsake

(6) Decades of salt spray had left the lighthouse's iron railing so ( ) that maintenance crews replaced the entire staircase.

1 condoned **2** coerced **3** collated **4** corroded

1 短文の語句空所補充（続き）

(7) The appellate judges ruled that hearsay testimony was ( ) in court unless corroborated by contemporaneous written records.

1 inadmissible **2** inadvertent **3** inalienable **4** inanimate

(8) Far from being a spontaneous folk custom, the autumn lantern parade had been ( ) in the 1920s by railway marketers.

1 conceded **2** concocted **3** condoned **4** congealed

(9) Because neonatal lungs are fragile, clinicians calibrate ventilators to deliver oxygen in ( ) puffs rather than forceful bursts.

1 measured **2** mendacious **3** mercurial **4** munificent

(10) The Ombudsman criticized the agency's ( ) response to tainted well water, noting that residents waited six weeks for test results.

1 discreet **2** didactic **3** dilatory **4** dexterous

(11) Once prized as a miracle insulator, asbestos became a textbook example of how unforeseen health hazards can ( ) an industrial material.

1 disinterested **2** disentangle **3** disseminate **4** discredit

(12) Although the two island dialects share core vocabulary, divergent vowel shifts have rendered them mutually ( ) to casual listeners.

1 unimpeachable **2** unintelligible **3** unpretentious **4** unscrupulous

1 短文の語句空所補充（続き）

(13) To keep dominant firms from locking out rivals, antitrust regulators barred exclusive contracts that would ( ) entry into regional fiber networks.

1 forbear **2** foreshadow **3** foreclose **4** forage

(14) The cellist's ( ) encore—just ninety seconds of unaccompanied Bach—left the packed hall in hushed admiration.

1 petulant **2** pithy **3** pompous **4** prolix

(15) Faced with shrinking snowy winters, several low-altitude ski resorts have tried to ( ) into year-round mountain-biking and trail hubs.

1 pivot **2** pilfer **3** placate **4** plummet

(16) Even the most promising lab prototype can ( ) in commercial production if engineers overlook how difficult it is to repair in the field.

1 flout **2** flourish **3** flaunt **4** flounder

(17) Rather than scrap the delayed freight timetable altogether, dispatchers chose to ( ) two low-volume midday stops until track work finished.

1 pan out **2** play up **3** pare back **4** patch up

(18) When three witnesses gave conflicting timelines, the investigator had to ( ) verifiable receipts from unvarnished guesswork.

1 sift out **2** stave off **3** gloss over **4** drum into

2 A 次の英文を読み、その文意にそって(19)から(21)までの（ ）に入れるのに最も適切なものを1, 2, 3, 4の中から一つ選び、その番号のマーク欄をぬりつぶしなさい。

Restoring Floodplains Beyond Higher Levees

For more than a century, river engineering in industrializing river basins followed a single imperative: hustle rainwater out to sea as fast as possible. Marshy meanders were dredged into straight concrete channels, and earthen levees were raised ever higher beside growing towns. Straightening a river certainly drains adjacent fields quickly during moderate rain. During extreme multi-day downpours, however, confining an entire watershed's runoff inside a narrow chute accelerates the flood wave and delivers a steeper wall of water to cities downstream.

Hydrologists studying repeated levee breaches recognized that heightening walls indefinitely creates a dangerous illusion of permanence. Behind tall embankments, municipalities approve new housing and warehouses on low-lying ground; if an unprecedented storm eventually overtops or undermines the levee, damage is catastrophic. Reconnecting selected stretches of rural floodplain—by setting levees farther back from the main channel—restores the river's natural safety valve. When water spills harmlessly across designated pastures or seasonal wetlands upstream, velocity drops and peak crests flatten by dozens of centimeters before reaching urban bridges. (***19***), sediment and agricultural phosphorus settle onto floodplain soils instead of clogging downstream harbors.

Compensating farmers fairly is essential to making "room for the river" politically durable. Several European and Japanese basin authorities now pay landowners flood-easement fees, keeping fields in normal agricultural use nine years out of ten while covering crop losses in the rare week when gates open. (***20***), shallow winter inundation on harvested rice paddies creates prime feeding grounds for migratory swans and herons.

Urban floodwalls remain indispensable where historic districts sit flush against riverbanks. Yet pairing urban defenses with upstream storage allows water managers to (***21***).

(19)

1 Despite such storage
2 On the contrary
3 Otherwise
4 As a side benefit

(20)

1 Conversely **2** In addition **3** Otherwise **4** Previously

(21)

1 accelerate flood waves so they strike harbors twice as fast
2 demolish all bridges in historic downtown districts
3 absorb extreme surges gracefully instead of gambling everything on wall height
4 ban agriculture throughout entire river valleys

2 B 次の英文を読み、その文意にそって(22)から(24)までの（ ）に入れるのに最も適切なものを1, 2, 3, 4の中から一つ選び、その番号のマーク欄をぬりつぶしなさい。

When Academic Journals Publish Null Results

Open almost any prestigious science or psychology journal, and the table of contents brims with breakthroughs: a compound that shrinks tumors in mice, a classroom technique that boosts test scores, or a catalyst that doubles battery life. Rarely will you read a headline announcing that a plausible hypothesis made no measurable difference at all. Behind that lopsided reading list lies a long-standing distortion known to methodologists as the "file-drawer problem."

For decades, peer reviewers and editors favored eye-catching positive findings while rejecting rigorous studies whose outcomes were statistically flat, leaving disappointed researchers to tuck negative data away in desk drawers. That habit quietly skews collective knowledge. If twenty laboratories independently test whether a herbal extract improves memory, and nineteen find zero effect while one sees a fluke improvement by chance, publishing only that lone success misleads doctors and patients alike. (***22***), other scientists waste years and grant money repeating failed experiments nobody warned them about.

To correct this bias, a growing coalition of journals has introduced "Registered Reports." Under this format, reviewers judge a study's research question, sample size, and statistical plan BEFORE a single measurement is collected. Once the protocol passes peer review, the journal commits in principle to publishing the paper regardless of how the numbers turn out, provided the team follows its approved plan. (***23***), shifting evaluation from flashy outcomes to methodological rigor removes the temptation to cherry-pick favorable data.

Null results rarely win newspaper headlines, yet making them visible is vital to helping science (***24***).

(22) **1** Until then **2** On the contrary **3** Fortunately **4** Worse still

(23) **1** Crucially **2** Reluctantly **3** Otherwise **4** By contrast

(24)

1 publish only experiments that confirm popular beliefs

2 correct its own dead ends and build a trustworthy record of reality

3 hide unsuccessful trials inside locked university basements

4 reduce sample sizes to speed up newspaper coverage

3 A 次の英文の内容に関して、(25)から(27)までの質問に対する答えとして最も適切なもの、または文を完成させるのに最も適切なものを1, 2, 3, 4の中から一つ選びなさい。

How Artificial Night Light Disrupts Pollinators

Discussions of declining insect pollinators typically center on habitat loss, pesticides, and climate shifts, with honeybees and bumblebees taking center stage in public campaigns. Over the past decade, however, ecologists tracking wild meadows after sundown have documented an overlooked disruption: artificial light at night from streetlamps, warehouse floodlights, and highway interchanges. Far from falling quiet at dusk, temperate ecosystems rely on a vast nocturnal shift of moths, beetles, and hoverflies that visit pale, fragrant blossoms while daytime bees sleep.

Field experiments in Swiss valleys illuminated half of a series of dark alpine meadows with standard white LED streetlamps while leaving matched control plots dark. Using night-vision cameras, researchers observed sixty-two percent fewer nocturnal pollinator visits to wild thistle and campion flowers under lit poles. Moths drawn upward into lamp glare spent hours circling fixtures or became easy prey for bats, leaving flowers below unpollinated. Even more unexpectedly, the damage spilled into the next afternoon: plants that missed nighttime pollination produced less nectar and fewer viable seeds, attracting fewer daytime bumblebees as well.

Replacing all outdoor lighting is neither realistic nor desirable where pedestrian safety is at stake, yet engineers and biologists have found room for compromise. Broad-spectrum blue-white LEDs disrupt insect vision most severely because short wavelengths strongly stimulate nocturnal compound eyes. Shielding fixtures so light points strictly downward onto pavement, dimming lamps during pre-dawn hours via motion sensors, and shifting toward warmer amber spectra substantially reduce insect attraction without leaving sidewalks in darkness.

3A How Artificial Night Light Disrupts Pollinators　設問 (25)〜(27)

(25) What surprising cascading effect did researchers observe in the illuminated Swiss meadow plots?

1 Reduced nighttime moth visits lowered seed set and even diminished daytime bee visits to those plants.

2 Daytime bumblebees began flying exclusively at midnight.

3 Thistle flowers grew three times taller under white LED poles.

4 Bats stopped hunting near streetlamps altogether.

(26) Why are broad-spectrum blue-white LEDs particularly disruptive to nocturnal insects?

1 They emit ultrasonic clicks that mimic predatory bats.

2 They heat surrounding air by ten degrees Celsius at midnight.

3 Their short wavelengths strongly stimulate the compound eyes of night-active insects.

4 They bleach colorful flower petals pure black within days.

(27) Which lighting strategy does the author endorse to balance human safety and pollinator conservation?

1 Eliminating all street lighting along urban sidewalks.

2 Installing unshielded upward-pointing floodlights with brighter blue bulbs.

3 Spraying wild meadows with synthetic nectar every morning.

4 Using downward-shielded fixtures, motion-activated pre-dawn dimming, and warmer amber spectra.

3 B 次の英文の内容に関して、(28)から(31)までの質問に対する答えとして最も適切なもの、または文を完成させるのに最も適切なものを1, 2, 3, 4の中から一つ選びなさい。

How Shipping Containers Reshaped Economic Geography

When historians list inventions that reshaped the post-1950 global economy, jet airliners and silicon microchips usually top the chart. Economists studying trade costs, however, often point to a far humbler object: the corrugated steel intermodal shipping container. Before standardized boxes debuted in the late 1950s, ocean freight moved as "breakbulk"—barrels, wooden crates, and burlap sacks hoisted net by net into a ship's hold and wrestled into place by large crews of longshoremen.

Breakbulk handling was astonishingly slow, expensive, and prone to damage or pilferage. A mid-sized cargo vessel could spend an entire week tied up at a pier while dockworkers unpacked railway boxcars and stowed thousands of irregular parcels by hand; port labor and insurance frequently cost more than steaming across the Atlantic itself. Because factories needed to sit close to deepwater piers to minimize overland cartage, major manufacturing districts clustered tightly around historic port cities such as New York, London, and Yokohama.

Agreeing through international standards committees in the 1960s on uniform box dimensions—twenty or forty feet long, with identical corner castings—transformed ships, cranes, trains, and truck chassis into a single interlocking machine. A sealed box packed at an inland factory could swing from highway trailer to rail flatcar to gantry crane without anyone touching its contents, slashing port turnaround times from a week to less than twenty-four hours and driving freight rates down by over ninety percent per ton.

Yet standardization redistributed prosperity unevenly. Historic finger-pier waterfronts with narrow streets could not accommodate sprawling container yards or deep-draft vessels; maritime jobs migrated overnight to purpose-built terminals miles away, hollowing out traditional dockside neighborhoods while enabling inland towns near highway junctions to join global supply chains. Even inconspicuous technical standards carry profound spatial consequences.

3B How Shipping Containers Reshaped Economic Geography 設問 (28)〜(31)

(28) Why did major manufacturing districts cluster close to historic port piers during the breakbulk era?

1 International law forbade building factories more than five miles from the ocean.

2 Loading and transferring irregular cargo was so slow and costly that firms minimized overland handling.

3 Railways had not yet been invented anywhere in Europe or North America.

4 Ocean steaming speeds were ten times faster in 1920 than in 1970.

(29) What was crucial to turning ships, trains, and trucks into an integrated transport system in the 1960s?

1 Replacing steel hulls with lightweight balsa wood.

2 Hiring three times as many dockworkers per cargo vessel.

3 International agreement on uniform container dimensions and corner fittings.

4 Eliminating customs inspections between all countries.

(30) How did containerization affect port turnaround times and per-ton shipping costs?

1 Ships stayed at piers twice as long, though insurance became slightly cheaper.

2 Turnaround times shrank from a week to under a day, and freight costs fell dramatically.

3 Port costs stayed unchanged while ocean crossing speeds tripled.

4 Only luxury goods could afford container freight rates.

(31) Why did many historic city-center waterfronts lose maritime jobs after containerization?

1 Their narrow streets and old finger piers lacked space and depth for vast container yards and larger ships.

2 Inland highway junctions banned trucks carrying forty-foot boxes.

3 Factory workers refused to live near New York, London, or Yokohama.

4 Gantry cranes could operate only in tropical climates.
