MANATOBI / ORIGINAL PRACTICE

英検2級
リーディングトレーニング

第10回 問題冊子

リスニング・英作文を含まない部分練習 ／ 全31問

大問	問題番号	内容
1	1〜17	短文の語句空所補充
2	18〜23	長文の語句空所補充
3	24〜31	読解

使い方

・解答用紙に答えを記入してください。問題冊子には正答を載せていません。
・問題・解説はA4縦、解答用紙はA4横。白黒・片面・実際のサイズ（100%）で印刷します。
・解き終わるまでは、別冊の解答・解説を開かないでください。
・同じ問題をアプリの分野別練習でも解けます。

独自作成した英検2級形式のリーディング第10回です。リスニング・英作文・面接は含みません。公式教材ではなく、CSE・合否換算はしません。筆記全体の公式時間をリーディングだけの時間に流用しません。外部難度校正は未実施です。

氏名：＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿

短文の語句空所補充
1〜4から最も適切な答えを一つ選び、解答用紙にマークしてください。

(1) To protect river otters during spring breeding, motorboats are forbidden to ( ) within fifty meters of reed banks.

1 appeal **2** appoint **3** applaud **4** approach

(2) Because the island's desalination plant runs on wind power, freshwater output fluctuates ( ) with seasonal breezes.

1 mutually **2** markedly **3** mentally **4** merely

(3) Although the new compost bin looked small, it proved capable of ( ) a week's worth of kitchen scraps from four families.

1 accelerating **2** accompanying **3** accommodating **4** accumulating

(4) All outdoor welding at the shipyard was halted ( ) lightning alerts across the bay.

1 in light of **2** in spite of **3** on behalf of **4** by way of

(5) Before lending antique violins to conservatory finalists, the foundation has each instrument ( ) for full replacement value.

1 inferred **2** inserted **3** insisted **4** insured

1　短文の語句空所補充（続き）

(6) Town planners remain (　　) about widening the bridge until soil engineers confirm the riverbank can bear extra weight.

1 cautious　**2** curious　**3** courteous　**4** contagious

(7) Switching delivery vans to off-peak night hours brought immediate (　　) to congested morning market streets.

1 remorse　**2** relief　**3** revenge　**4** refusal

(8) Were the city archive to digitize its glass-plate negatives, historians worldwide (　　) examine Meiji-era street scenes from home.

1 will　**2** can　**3** could　**4** have

(9) Because freshly roasted coffee beans release carbon dioxide for days, bags are fitted with one-way valves lest they (　　) open.

1 bend　**2** burst　**3** bury　**4** boast

(10) After the landslide blocked the main rail line, express passengers were (　　) to buses between two mountain stations.

1 transplanted　**2** transmitted　**3** transformed　**4** transferred

1 短文の語句空所補充（続き）

(11) Although the two sisters trained under the same tea master, their movements are ( ) different in tempo and grace.

1 subtly **2** solely **3** scarcely **4** shortly

(12) Frequent freeze-thaw cycles in March can cause ( ) potholes on mountain roads unless cracks are sealed in autumn.

1 secure **2** serene **3** severe **4** scarce

(13) To ( ) curiosity about marine biology, the aquarium lets third graders touch sea stars in a shallow tide pool.

1 spoil **2** spare **3** spill **4** spark

(14) Even seasoned bird-watchers have trouble telling winter gulls ( ) without binoculars.

1 ahead **2** aside **3** apart **4** aloud

(15) Volunteers spent Sunday afternoon pulling invasive waterweed to stop it from taking ( ) the village lotus pond.

1 after **2** over **3** off **4** away

1　短文の語句空所補充（続き）

(16) All protective helmets sold in the cycling shop meet national impact (　　).

1 standards　**2** standpoints　**3** statements　**4** statistics

(17) Rather than discard chipped ceramic mugs, Ms. Ito learned gold-lacquer repair to (　　) their daily life at the table.

1 proclaim　**2** provoke　**3** prohibit　**4** prolong

Why Escalator Steps Have Deep Grooves Along Their Treads

Look down at the moving metal steps of any train-station escalator, and you will see dozens of narrow parallel ridges and grooves running from back to front—never side to side. Passengers sometimes assume those grooves exist mainly to give wet sneakers extra grip on rainy days. While texture does help drainage, mechanical engineers designed those deep longitudinal cleats primarily so the steps can disappear safely at the end of the ride.

At the top and bottom landings of an escalator, moving steps slide beneath a stationary metal plate edged with sharp teeth, called the "comb plate." Those comb teeth mesh right inside the grooves of each passing step with less than two millimeters to spare. Instead of hitting a flat edge where shoe soles, umbrella tips, or wheeled luggage could catch, passengers glide smoothly off the ridges onto the solid floor. (18), small objects like gravel or dropped coins are scooped upward onto the landing rather than dragged down into the return machinery.

Keeping that comb-and-groove partnership safe requires watchful upkeep. If a heavy steel cart chips even two adjacent comb teeth, a dangerous snagging gap opens up. Modern escalators wire sensitive switches behind the comb plate that halt the motor instantly if anything jams under a tooth. (19), yellow painted borders frame each tread to warn riders away from the hinge seams between steps.

Every detail of an escalator step shows how everyday transit hardware (20).

(18)

1 On the contrary
2 At the same time
3 Otherwise
4 Nevertheless

(19)

1 By accident
2 Conversely
3 In addition
4 Instead

(20)

1 embeds layered safety engineering beneath our feet
2 is carved sideways purely for artistic decoration
3 operates safely even when half its comb teeth are missing
4 requires passengers to jump over the landing plate

How Community Tool Libraries Cut Waste and Build Skills

Walk down the hardware aisle of a home-improvement store, and you will see high-pressure washers, tile cutters, post-hole diggers, and orbital sanders gleaming on the shelves. Useful as these machines are during a weekend renovation, industry surveys suggest the average household power drill runs for fewer than thirty minutes across its entire lifetime before sitting idle in a garage.

Recognizing the absurdity of fifty neighbors on one street each owning an identical ladder that gathers dust, residents in cities from Portland and Edinburgh to Kyoto have launched nonprofit "tool libraries." For a modest annual membership—often less than the cost of buying a single saw—members check out commercial-grade tools for a week just like library books. Sharing one sturdy sander among forty households cuts raw manufacturing demand for copper motors, lithium packs, and molded plastic housings. (21), apartment dwellers without garages can tackle home repairs they once had to postpone.

Tool libraries quickly discover that lending hardware is only half their value. Beginners borrowing a sewing machine or circular saw for the first time need safe habits, so retired cabinetmakers and electricians volunteer on Saturday mornings to teach hands-on safety clinics. (22), neighbors swap leftover paint, spare screws, and practical advice over workbenches.

Not every item suits shared lending—cheap paintbrushes wear out fast—yet pooling durable equipment offers neighborhoods (23).

(21)

1 Previously
2 On the contrary
3 Otherwise
4 Equally important

(22)

1 Along the way
2 Nevertheless
3 In vain
4 Conversely

(23)

1 a reason to buy fifty identical power drills per block
2 lower living costs, less resource waste, and stronger local ties
3 unlimited free paintbrushes that never wear out
4 quieter streets by banning home repairs completely

Instructions for Participating in the River Salmon Fry Release

From: Kitagawa Watershed Conservation Association
To: Registered Families and High School Volunteers
Subject: Bucket acclimatization rule for Sunday's salmon fry release

Dear participants,
Thank you for joining our annual chum salmon fry release at Kitagawa River Park this Sunday at 10:00 a.m.! Over the winter, student volunteers tended fertilized eggs in chilled hatchery trays, and twelve thousand five-centimeter young salmon are now ready to begin their journey to the Pacific.

When you receive your small plastic bucket of fry at the riverside tent, please do NOT pour the fish straight into the river right away. Hatchery tank water is nine degrees Celsius, whereas sunlit river shallows may be three degrees warmer or cooler; a sudden temperature shock stuns tiny fish and leaves them vulnerable to birds.

Instead, crouch safely at the gravel edge, dip half your bucket into the river to mix river water in gradually over two minutes, and then tilt the rim gently underwater so the fry swim out on their own. Life jackets will be lent to all children under twelve.

Kitagawa Conservation Staff

Instructions for Participating in the River Salmon Fry Release — Questions

(24) Why must participants avoid pouring salmon fry straight from the bucket into the river?

1 Twelve thousand fish cannot fit in the Pacific Ocean.

2 Plastic buckets dissolve if tilted too fast.

3 Sudden temperature differences between tank water and river water can shock the young fish.

4 River water is boiling hot in spring.

(25) What should participants do for two minutes at the gravel edge before releasing the fry?

1 Count all twelve thousand fish one by one.

2 Gradually mix river water into their bucket to equalize the temperature.

3 Feed bread crumbs to nearby river birds.

4 Warm the bucket with a portable heater.

(26) Who will receive borrowed life jackets at the event?

1 No one—participants must buy their own.

2 Only experienced hatchery scientists.

3 High school teachers who stay in the parking lot.

4 All children under twelve years old.

Why Museums Control Light Exposure with Strict "Lux Budgets"

Step from a sunlit sculpture court into a gallery displaying Japanese ukiyo-e woodblock prints, medieval illuminated manuscripts, or nineteenth-century watercolor landscapes, and the room can feel surprisingly dim—almost like twilight. Visitors occasionally wonder whether the museum is cutting electricity costs. Conservators have a far more urgent motive: light itself is an invisible chemical force that permanently fades organic pigments and weakens paper fibers.

Unlike oil paintings on canvas or glazed ceramics—whose mineral pigments locked in linseed oil or glass tolerate moderate museum lighting well—plant dyes, insect inks, silk threads, and watercolor washes contain fragile molecular bonds. Photons of light, especially high-energy ultraviolet rays and blue wavelengths, snap those bonds one by one. Worse still, photochemical damage is strictly cumulative and irreversible: exposing a delicate Hiroshige print to bright gallery lamps for one week causes roughly the same fading as ten weeks under lamps one-tenth as bright, and no rest in a dark vault afterward can bring lost blues or purples back.

To balance public enjoyment today against preservation for centuries ahead, major museums manage fragile works under an annual "lux-hour budget." Illuminance is capped at just fifty lux—roughly a fifth of normal office brightness—with all ultraviolet filtered out. Curators also track how many hours each print spends on display; once a work reaches its yearly allowance, say three months, it returns to dark climate-controlled storage while a companion print takes its place.

Modern LEDs free of ultraviolet heat, paired with motion sensors or velvet curtains that visitors lift briefly inside display cases, stretch those precious light budgets further than ever.

Dim rooms and rotating exhibitions may test a visitor's patience, yet they ensure our grandchildren will still see the artist's original colors rather than pale ghosts.

Why Museums Control Light Exposure with Strict "Lux Budgets" — Questions

(27) Why are galleries showing woodblock prints, textiles, or watercolors kept noticeably dim?

1 Light triggers chemical reactions that permanently fade organic dyes and weaken paper or silk.

2 Museums turn off half their lamps to lower summer power bills.

3 Visitors prefer guessing colors in the dark.

4 Oil paintings and glazed ceramics melt at normal office brightness.

(28) What does the author mean by saying light damage to fragile pigments is "cumulative and irreversible"?

1 Only sunlight from open windows causes fading, never indoor lamps.

2 Colors fade during winter but grow brighter again every August.

3 Fading adds up with total light exposure over time, and storing a print in the dark cannot restore lost colors.

4 Prints suffer zero damage as long as museum rooms stay below twenty degrees.

(29) How does an annual "lux-hour budget" work in museum practice?

1 Every painting is repainted with fresh blue dye once a year.

2 Visitors pay fifty yen per hour to rent flashlights.

3 Museums display all prints outdoors on cloudy days only.

4 Curators limit brightness to around fifty lux and rotate fragile works back into dark storage after a set display period.

(30) How do motion sensors or small curtains over display cases help conservators?

1 They warm ancient silk threads to forty degrees.

2 They keep dust and insects out of oil paintings.

3 They cut unnecessary light exposure when nobody is looking directly at the artwork.

4 They photograph visitors who stand too close.

Why Museums Control Light Exposure with Strict "Lux Budgets" — Questions (continued)

(31) What is the author's main point in the concluding paragraph?

1 Museums should lock all watercolors in vaults permanently and show only photographs.

2 Modest brightness and rotating displays are worthwhile trade-offs so future generations can experience original colors.

3 Modern LEDs allow fragile prints to stay under bright spotlights forever.

4 Grandchildren prefer pale faded prints over vivid ones.
