MANATOBI / ORIGINAL PRACTICE

英検準2級プラス
リーディングトレーニング

第10回 問題冊子

リスニング・英作文を含まない部分練習 ／ 全31問

大問	問題番号	内容
1	1〜17	短文の語句空所補充
2	18〜23	長文の語句空所補充
3	24〜31	読解

使い方

・解答用紙に答えを記入してください。問題冊子には正答を載せていません。
・問題・解説はA4縦、解答用紙はA4横。白黒・片面・実際のサイズ（100%）で印刷します。
・解き終わるまでは、別冊の解答・解説を開かないでください。
・同じ問題をアプリの分野別練習でも解けます。

独自作成した英検準2級プラス形式のリーディング第10回です。リスニング・英作文・面接は含みません。公式教材ではなく、CSE・合否換算はしません。筆記全体の公式時間をリーディングだけの時間に流用しません。外部難度校正は未実施です。

氏名：＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿＿

1

短文の語句空所補充
1〜4から最も適切な答えを一つ選び、解答用紙にマークしてください。

(1) To ( ) accidental burns, the chemistry lab requires students to roll up loose sleeves.

1 preserve **2** prevent **3** pretend **4** predict

(2) The ferry departs promptly at nine, ( ) of how many passengers are still buying snacks.

1 worthy **2** mindful **3** capable **4** regardless

(3) After comparing repair quotes from three garages, Dad opted ( ) the neighborhood shop.

1 for **2** into **3** under **4** across

(4) Because granite absorbs very little water, these outdoor steps remain remarkably ( ) for decades.

1 edible **2** flexible **3** durable **4** portable

(5) Only when the applause died down ( ) the conductor turn around to bow a second time.

1 had **2** did **3** was **4** has

1　短文の語句空所補充（続き）

(6) Many commuters switch to cycling in April to cut (　　) on monthly train expenses.

1 into　**2** off　**3** down　**4** away

(7) The botanist warned that introducing foreign beetles could upset the island's delicate ecological (　　).

1 barrier　**2** budget　**3** baggage　**4** balance

(8) All rental violins must be inspected for bridge cracks prior to (　　) lent to new students.

1 being　**2** be　**3** been　**4** having

(9) Although the hostel rooms are compact, clean linen and friendly staff more than make (　　) for the size.

1 over　**2** out　**3** off　**4** up

(10) The town archive digitized faded nineteenth-century newspapers lest the brittle paper (　　) completely.

1 crumbles　**2** crumble　**3** crumbled　**4** crumbling

1　短文の語句空所補充（続き）

---

(11) A sudden drop in air pressure is often an early (　　) of an approaching coastal storm.

1 imitation　**2** invitation　**3** indication　**4** obligation

(12) Having grown up beside a noisy rail yard, Kenji can sleep soundly no matter how loud a train (　　) be.

1 may　**2** must　**3** had　**4** was

(13) The city council set (　　) two million yen to plant shade trees along school walking routes.

1 about　**2** aside　**3** forth　**4** in

(14) Visitors touring the glassworks must wear protective goggles at all (　　) inside the furnace hall.

1 times　**2** hours　**3** moments　**4** days

(15) Far from (　　) discouraged by her fourth-place finish, Aoi analyzed her split times that same evening.

1 to be　**2** be　**3** been　**4** being

1　短文の語句空所補充（続き）

---

(16) The bakery's sourdough loaves are baked in small batches, so afternoon shoppers rarely find any left in (　　).

1 shelf　**2** store　**3** stock　**4** supply

(17) To make the science poster easier to follow, Ms. Kato advised replacing dense paragraphs with (　　) bullet points.

1 clumsy　**2** concise　**3** casual　**4** chronic

Why Escalator Brushes Line the Bottom of Every Side Skirt

Look down beside your shoes the next time you ride a station escalator, and you will see stiff black nylon bristles sticking out just above the moving metal steps. Playful commuters occasionally brush dust off their sneakers against them, assuming that shoe cleaning is why engineers put them there. In reality, those "skirt deflector brushes" are a mandatory safety device.

Escalator steps must glide past stationary side panels with a tiny clearance gap of a few millimeters. Without a physical reminder, passengers standing too close to the wall risk having soft rubber rain boots, long coat hems, or dangling shoelaces pulled into that narrow gap as steps fold flat at the landing. Stiff bristles tickle ankles gently the instant a foot drifts sideways. (18), riders instinctively shift half a step toward the safe center of the tread without even looking down.

Brushes help maintenance crews indirectly as well. Coins, ticket stubs, and small pebbles dropped from pockets bounce off the angled bristles instead of wedging into moving gears underneath. (19), mechanics inspect worn or bent brush strips every month just as carefully as brakes.

A row of simple nylon bristles illustrates how subtle tactile cues can (20).

(18)

1 Despite this
2 On the contrary
3 Otherwise
4 As a result

(19)

1 For these reasons
2 Conversely
3 By accident
4 Instead

(20)

1 make escalators run three times faster during rush hour
2 polish leather shoes to a mirror shine in ten seconds
3 prevent serious accidents quietly without alarms or signs
4 replace metal steps with soft nylon carpets

How Sponge Sidewalks Help Cities Handle Cloudbursts

Summer weather in many temperate cities has grown more uneven: weeks of dry heat are increasingly interrupted by intense one-hour cloudbursts that dump a month's rain in a single afternoon. Conventional streets paved from wall to wall with waterproof asphalt funnel every liter of rain straight into underground storm pipes. When pipes reach capacity, intersections flood while tree roots two meters below the pavement remain bone-dry.

To break this paradox, civil engineers are redesigning sidewalks as "rain gardens" and permeable pavements—part of what urban hydrologists call "sponge cities." Replacing solid concrete slabs along curb lanes with porous interlocking bricks, crushed-gravel trenches, and shallow planted basins lets rainwater soak straight into engineered soil beds beneath pedestrians' feet. (21), peak runoff entering municipal storm drains during a sudden downpour can drop by forty percent or more.

Storing moisture underground pays off weeks later when clear, hot weather returns. Street trees draw on that trapped soil water and release cool vapor through their leaves, lowering sidewalk temperatures noticeably. (22), gravel layers and plant roots filter brake dust and oil droplets out of street water before it seeps toward rivers.

Retrofitting every avenue takes years of utility coordination, so cities prioritize flood-prone low spots first. Step by step, porous streets turn sudden rain from an urban hazard into (23).

(21)

1 Nevertheless
2 Consequently
3 On the contrary
4 Previously

(22)

1 Instead
2 Otherwise
3 In addition
4 Reluctantly

(23)

1 hotter asphalt during August afternoons
2 a reason to cut down every street tree downtown
3 permanent lakes blocking buses all summer
4 a stored resource that cools and cleans neighborhoods

Guidelines for Borrowing Astronomical Telescopes

From: Earth Science Club Equipment Team
To: First-Year Club Members
Subject: Mandatory training and dew-shield rule for home telescope loans

Hi first-year members,
Starting June 1, members who have completed our thirty-minute setup workshop may borrow one of the club's four portable refractor telescopes over the weekend to observe the Moon and Jupiter from home!

Before signing the loan book, please remember two care rules that protect delicate optical coatings. First, attach the long black plastic dew shield to the front tube every evening you observe; clear nights cool the glass lens rapidly, causing moisture to condense on it within minutes.

Second, if morning dew or mist DOES form on the objective lens, NEVER wipe it with tissues, handkerchiefs, or shirt sleeves—tiny dust fibers scratch anti-reflection coatings permanently. Simply bring the uncapped tube indoors, point it slightly downward in a dry room until the moisture evaporates naturally, and only then put the dust cap back on.

Clear skies,
Equipment Team

Guidelines for Borrowing Astronomical Telescopes — Questions

(24) Who is eligible to borrow a portable telescope for the weekend starting June 1?

1 Members who have finished the thirty-minute setup workshop.

2 Any student in the school without training.

3 Only third-year club presidents.

4 Parents who own an observatory.

(25) Why must members attach the black dew shield to the front tube each evening?

1 It keeps stray dogs away from the tripod.

2 It blocks moonlight so Jupiter looks darker.

3 It doubles the telescope's magnification.

4 Clear night air cools the glass quickly and makes moisture condense on the lens.

(26) What should a member do if moisture forms on the objective lens?

1 Rub it firmly with a clean paper tissue.

2 Let it dry naturally uncapped in a dry room before putting the cap back on, without wiping.

3 Seal the wet lens immediately under the dust cap.

4 Dry it over a gas kitchen stove.

How Braille Evolved into a Universal Tactile Code

Today, raised six-dot Braille characters appear everywhere from elevator buttons and medicine boxes to railway handrails and refreshable electronic displays. Simple as that two-by-three grid of dots looks under a fingertip, creating a writing system that blind people could both read rapidly AND write independently took decades of experimentation—and the insight of a fifteen-year-old student.

In early nineteenth-century Paris, the handful of books printed for blind students used large embossed Roman letters pressed into thick wet paper. Although sighted teachers liked embossed letters because they looked familiar to the eye, reading them by touch was painfully slow: a finger had to trace every curve of an S or B, taking minutes to decipher a single paragraph. Worse still, students had no practical way to emboss curved letters themselves to take class notes or write letters home.

Change arrived in 1821 when a retired French artillery captain, Charles Barbier, visited Paris's Royal Institute for Blind Youth to demonstrate "night writing"—a twelve-dot code of raised points designed so soldiers could read silent messages in the dark without striking a match. Twelve-year-old Louis Braille immediately grasped the breakthrough: fingers recognize distinct dot patterns in a single instant far better than traced lines.

Yet Barbier's twelve-dot grid was too tall to fit beneath one stationary fingertip, forcing the finger to move up and down on every symbol, and it lacked punctuation or musical notation. Working tirelessly during spare hours with a pointed awl, young Louis trimmed the cell to just six dots—three high by two wide. That compact size let a reader's index finger take in an entire letter at one touch and glide smoothly across a line at over a hundred words per minute, while the same slate and stylus let anyone punch notes effortlessly.

Adapted since into dozens of languages, mathematics, computer code, and musical scores, Louis Braille's six-dot cell endures because it was designed for the human fingertip rather than the human eye.

How Braille Evolved into a Universal Tactile Code — Questions

(27) Why were embossed Roman letters frustrating for blind students in early nineteenth-century Paris?

1 The wet paper dissolved within ten minutes.

2 Sighted teachers could not read Roman letters.

3 Tracing curved shapes by touch was extremely slow, and students could not easily write them on their own.

4 Books written in Roman letters weighed fifty kilograms each.

(28) What was Charles Barbier's "night writing" originally invented for?

1 Allowing soldiers to read silent messages in darkness without lighting a match.

2 Writing symphony music for Paris orchestras.

3 Labeling medicine boxes in pharmacies.

4 Teaching five-year-old children the French alphabet.

(29) What main flaw did Barbier's twelve-dot cell have when read by touch?

1 Its dots were too small to feel even with a microscope.

2 It was too tall to fit under a single fingertip without moving up and down.

3 It could only represent numbers from one to five.

4 It required electricity to heat the dots.

(30) How did Louis Braille's six-dot cell improve reading speed and writing?

1 One fingertip could feel a whole character at a single touch, and students could punch dots themselves with a stylus.

2 It made embossed Roman letters three times larger.

3 It read pages aloud using mechanical bells.

4 It eliminated the need to learn spelling.

(31) According to the final paragraph, why has Braille's system endured across languages, math, and music?

1 Only French words can be written in six dots.

2 Governments banned audio recordings in schools.

3 Six-dot cells look identical to printed Latin letters.

4 It was designed for how the fingertip feels shapes rather than how the eye sees.
