準1級

ROUND 02

英検準1級形式

一次筆記（リーディング・ライティング）

第2回 問題冊子 ｜ 筆記目安時間：90分 ｜ 選択問題 31問 ＋ ライティング 2題

■ 出題構成・自己採点記録表

大問	問題番号	出題形式・内容	設問数	自己採点・点検
1	(1)〜(18)	短文の語句空所補充	18問	／18
2	(19)〜(24)	長文の語句空所補充	6問	／6
3	(25)〜(31)	長文の内容一致選択	7問	／7
4	Writing 1	ライティング（英文要約）（目安 60〜70語）	1題	□ 自己点検済
5	Writing 2	ライティング（英作文・意見論述）（目安 120〜150語）	1題	□ 自己点検済

■ 演習・印刷の手引き

1. 問題冊子には正答や解説を載せていません。解答用紙は2ページ構成です（1ページ目：A4横マークシート／2ページ目：A4縦ライティング解答欄）。
2. 印刷時は「白黒・片面・実際のサイズ（100%）」を選ぶと、マーク欄や英作文罫線が実寸で出力されます。

3. 解き終わるまでは「解答・解説」を開かず、本番と同じ時間配分を意識して取り組んでください。
4. 同じ選択問題はアプリの「分野別練習」、英作文課題はアプリの「ライティング練習」でも学習・保存できます。

実施日：　　年　　月　　日　　開始〜終了：　　：　　〜　　：

※ 本冊子はマナトビが独自に執筆・編集した英検準1級形式のオリジナル教材（第2回）です。リスニング・二次面接は含みません。日本英語検定協会の公式過去問・公式予想問題ではなく、CSEスコア算出や合否判定は行いません。外部機関による難度校正は未実施です。

1

短文の語句空所補充
1〜4から最も適切な答えを1つ選び、その番号を解答用紙にマークしなさい。

(1) The inquiry concluded that the bridge failure resulted not from a single storm, but from years of ( ) maintenance.

1 negligent **2** affluent **3** eloquent **4** benign

(2) To prevent conflicts of interest, board members must ( ) any financial ties they have to bidding contractors.

1 fabricate **2** disclose **3** oppress **4** ignite

(3) Although the diplomat's remarks sounded cordial, they contained an ( ) warning against further border restrictions.

1 implicit **2** obsolete **3** arid **4** erratic

(4) Several coastal municipalities have formed a coalition to ( ) the central government for stronger seawall funding.

1 detain **2** subside **3** lobby **4** evict

(5) New satellite measurements have ( ) the once-popular theory that the glacier was fed solely by winter snowfall.

1 corroborated **2** refuted **3** appeased **4** hoarded

(6) Without affordable childcare, initiatives to boost rural employment are unlikely to gain much ( ).

1 traction **2** friction **3** captivity **4** notoriety

1　短文の語句空所補充（続き）

(7) The novelist's early manuscripts were remarkably (　　), running to nearly a thousand pages before her editor trimmed them.

1 succinct　**2** prolific　**3** verbose　**4** docile

(8) Hospital administrators introduced staggered shifts to (　　) the bottleneck at the pharmacy counter around noon.

1 aggravate　**2** perpetuate　**3** emulate　**4** alleviate

(9) Even seasoned botanists can be (　　) by the striking resemblance between the edible mushroom and its toxic cousin.

1 deceived　**2** reconciled　**3** endowed　**4** exempted

(10) Strict confidentiality rules forbid mediators from revealing anything said during talks, lest trust between the parties (　　).

1 erodes　**2** erode　**3** eroded　**4** eroding

(11) The orchestra's financial recovery was (　　) in large part to a bequest from a retired music teacher.

1 susceptible　**2** attributable　**3** analogous　**4** indifferent

(12) Critics argued that the housing subsidy was merely a (　　) measure that failed to address the shortage of construction workers.

1 perennial　**2** mandatory　**3** stopgap　**4** lucid

1　短文の語句空所補充（続き）

(13) When the main supplier abruptly went bankrupt, the electronics maker had to (　　) domestic workshops to keep assembly lines running.

1 clamp down on　**2** brush up on　**3** miss out on　**4** fall back on

(14) Far from (　　) public anxiety, the spokesperson's vague answers fueled speculation that the project was behind schedule.

1 provoking　**2** allaying　**3** compiling　**4** forfeiting

(15) The archaeological permit was granted on the strict (　　) that every excavated artifact remain in the regional museum.

1 digression　**2** complacency　**3** stipulation　**4** animosity

(16) Initial enthusiasm for the car-sharing scheme began to (　　) once members realized vehicles were rarely available on weekends.

1 thrive　**2** surge　**3** hoist　**4** wane

(17) The regulatory agency decided to (　　) the small rural co-ops from reporting rules designed for multinational banks.

1 exempt　**2** coerce　**3** indict　**4** immerse

(18) During the drought, villagers had to (　　) out their remaining grain reserves carefully until the autumn harvest.

1 rule　**2** phase　**3** eke　**4** weed

1〜4から最も適切な答えを1つ選び、その番号を解答用紙にマークしなさい。

Why Automated Translations Still Struggle with Municipal Notices

Local governments increasingly use automated translation tools to publish storm alerts, waste-sorting rules, and clinic schedules in dozens of languages within seconds. Compared with waiting days for external agencies to translate routine updates, instant software appears both economical and inclusive. Yet emergency managers have learned that linguistic fluency on screen can mask dangerous misunderstandings.

Public notices are full of compressed local shorthand. A message stating that "riverside shelters open following level-three advisories" assumes readers already know the municipal warning scale, while a phrase like "collection suspended pending road clearance" can be rendered grammatically yet ambiguously in another language. Machine systems trained predominantly on general web text often smooth over uncertain terms into confident-sounding sentences. Readers may therefore fail to realize that a crucial condition has been **(19)**.

Several cities have responded not by abandoning translation software, but by changing how source notices are written in the first place. Officials draft announcements using controlled templates that avoid idioms, spell out dates and locations explicitly, and separate instructions from background explanations. Bilingual community reviewers then audit high-stakes safety templates in advance. **(20)**, routine updates such as revised opening hours can be inserted into verified structures with far fewer errors.

The broader lesson is that translation quality begins upstream of the algorithm. Treating automated output as a finished public service risks confusing speed with comprehension, whereas pairing structured source writing with human oversight allows agencies to **(21)**.

(19)

1 translated into ancient poetry
2 distorted or omitted in the output
3 printed exclusively on stone tablets
4 verified by every resident in person

(20)

1 Once those frameworks are established
2 Even before any template is written
3 In opposition to clear writing
4 Regardless of safety accuracy

(21)

1 replace all emergency shelters with translation apps
2 communicate swiftly without sacrificing reliability
3 encourage officials to use more ambiguous idioms
4 restrict storm alerts to a single language

The Hidden Bias in Citizen Pothole Apps

Many municipal governments now offer smartphone applications that let residents photograph damaged pavement, broken streetlights, or blocked drains and send the exact GPS coordinates to repair crews. At first glance, crowdsourced reporting looks like a triumph of responsive governance: problems are spotted faster than inspectors could patrol every street, and citizens can track repair progress online.

When urban researchers compared app submissions against independent street-condition surveys across an entire city, however, a troubling discrepancy emerged. Wealthier districts with younger, tech-savvy commuters generated four times as many reports per kilometer of damaged road as older, lower-income neighborhoods where fewer residents used municipal apps or trusted rapid official action. Dispatching crews strictly in the order reports arrived meant that technology had inadvertently **(22)**.

Recognizing this pattern did not mean shutting down the reporting platform. Citizen photos still saved inspectors valuable time on urgent hazards such as fallen branches after a storm. Instead, the public works department combined app reports with scheduled baseline inspections weighted toward neighborhoods with older infrastructure and historically low reporting rates. **(23)**, maintenance budgets were no longer driven solely by who complained fastest on a smartphone.

Digital participation tools often promise neutrality because anyone is theoretically free to download them. Yet equal permission to use a channel rarely produces equal representation in the resulting dataset. Responsible public administration therefore requires officials to **(24)** before turning user-generated maps into spending priorities.

(22)

1 eliminated every pothole in older districts first

2 tilted public maintenance toward already advantaged areas

3 prevented wealthy commuters from owning smartphones

4 made independent street surveys impossible to conduct

(23)

1 In this way

2 Despite the inspections

3 Conversely

4 At the outset

(24)

1 charge a fee whenever a resident reports a broken light

2 account for whose voices are underrepresented in incoming data

3 rely exclusively on smartphone submissions for all planning

4 stop repairing fallen branches after storms

1〜4から最も適切な答えを1つ選び、その番号を解答用紙にマークしなさい。

Why Negative Scientific Results Deserve Publication

Pick up almost any prominent scientific journal and you will read predominantly about experiments that worked: a compound that slowed disease progression in mice, a teaching intervention that raised test scores, or a catalyst that accelerated a chemical reaction. Studies in which a plausible hypothesis produced no statistically meaningful effect are far more likely to remain unpublished in laboratory drawers—a phenomenon methodologists call the "file-drawer problem."

This publication pattern rarely stems from deliberate dishonesty. Journals compete for attention and citations, editors favor striking breakthroughs, and researchers under career pressure understandably prioritize manuscripts with a high chance of acceptance. Writing up a rigorous null result takes nearly as much time as writing up a positive discovery, yet brings far less professional recognition. Individual incentives therefore align to filter out negative findings.

The collective cost to science, however, is substantial. When five independent laboratories test the same promising idea and four find no effect while one obtains a positive result by chance, publishing only the fifth study creates a distorted impression of effectiveness. Other teams may then spend years and public grant money repeating dead-end experiments they had no way of knowing had already failed. Worse still, clinical or policy reviews that pool published studies risk overestimating the benefits of an intervention.

One promising reform is the "registered report." Under this format, peer reviewers evaluate a study's research question, sample size, and experimental protocol before data are collected. If the design is sound and the question important, the journal commits in principle to publishing the paper regardless of how the numbers turn out, provided the researchers follow the approved plan. Early evaluations suggest that registered reports contain a much higher proportion of null findings than conventional journals while maintaining high methodological quality.

Registered reports do not suit purely exploratory research where methods evolve mid-experiment, nor do they eliminate the need for replication. Yet they address a structural flaw that exhortations to individual virtue cannot fix alone: shifting prestige from whether a result looks dramatic to whether an investigation was worth conducting and carefully executed.

Why Negative Scientific Results Deserve Publication — Questions

(25) According to the second paragraph, why do many null results remain unpublished?

1 Most null results are produced by researchers who falsify their data.

2 Writing up a null study requires ten times more funding than a positive study.

3 Journal selection preferences and career rewards discourage researchers from submitting them.

4 Government laws prohibit journals from printing unsuccessful trials.

(26) What danger arises when only chance positive findings are published while null studies stay hidden?

1 Other researchers may waste resources repeating failed approaches, and reviews may overestimate benefits.

2 Laboratories stop applying for public research grants altogether.

3 Every published positive finding is guaranteed to be completely fraudulent.

4 Peer reviewers are forced to conduct all laboratory experiments themselves.

(27) How does the "registered report" format change the publication process?

1 It commits to publishing a study based on its prior design and question quality before outcomes are known.

2 It accepts only purely exploratory studies whose methods change every week.

3 It requires authors to guarantee a dramatic breakthrough before collecting data.

4 It removes peer review completely to speed up publication.

Repairing Rivers by Slowing Them Down

For much of the twentieth century, river engineering in agricultural valleys followed a straightforward logic: get rainwater off fields and out to sea as rapidly as possible. Winding streams were straightened into deep uniform channels, riverside marshes were drained, and fallen trees were cleared away so nothing obstructed flow. Locally, these measures turned wet meadows into productive farmland and reduced minor seasonal inundation along adjacent fields.

Downstream towns, however, paid an unexpected price. Straightened channels acted like smooth pipes, accelerating runoff from hillside storms so water from multiple tributaries arrived at urban bridges simultaneously in sharp, destructive peaks. At the same time, fast-moving currents scoured gravel from streambeds, destroying spawning habitats for native trout and lowering surrounding groundwater tables so pastures dried out faster during summer droughts.

Over the past two decades, hydrologists have tested an approach that reverses parts of this legacy without rebuilding vast concrete dams. Working in upper catchments where streams are still small, teams install "leaky woody structures"—bundles of felled logs pinned securely across channels with gaps underneath. During normal weather, base flow passes freely beneath the logs so fish can migrate unhindered. When heavy rain swells the stream, the logs intercept the upper layer of water, nudging it temporarily onto rough woodland floodplains and shallow storage ponds.

Individually, a single log barrier holds back only a modest volume. Across dozens of headwater streams, however, hundreds of small delays desynchronize tributary peaks, flattening the flood wave that eventually reaches downstream towns. Sediment and organic matter also settle behind the structures, gradually rebuilding varied streambeds where aquatic insects thrive.

Implementing natural flood management nonetheless involves delicate negotiation. Upstream landowners bear the inconvenience of saturated corners of pasture or woodland, whereas the greatest financial protection accrues to homeowners miles downstream. Expecting farmers to host water out of goodwill alone rarely succeeds at scale. Successful catchment partnerships therefore pair hydrological modeling with multi-year stewardship payments, clear liability rules if timber shifts, and joint monitoring that lets farmers see measurable effects on summer soil moisture as well as downstream flood peaks.

Repairing Rivers by Slowing Them Down — Questions

(28) What unintended consequence did twentieth-century stream straightening produce?

1 Water remained trapped on hillside farms for months.

2 Accelerated tributary flows converged downstream in sharper flood peaks and eroded habitats.

3 Native trout populations multiplied excessively in deep uniform channels.

4 Groundwater levels rose so high that summer droughts disappeared.

(29) How do "leaky woody structures" function differently in normal weather versus heavy rain?

1 They block fish migration in dry weather but float away during storms.

2 They let ordinary flow and fish pass underneath while diverting high water onto floodplains.

3 They pump groundwater into concrete pipes only during winter.

4 They seal the streambed completely so no sediment can ever settle.

(30) Why are hundreds of small barriers across headwater streams effective?

1 Each single log barrier can hold as much water as a giant concrete dam.

2 Together they stagger the timing of tributary flows, lowering the peak reaching towns.

3 They evaporate ninety percent of rainwater before it reaches any river.

4 They permanently dry up downstream rivers throughout the year.

(31) Why do successful catchment programs include payments, liability rules, and joint monitoring?

1 Because upstream landowners bear local costs while primary flood savings occur downstream.

2 Because downstream homeowners own all agricultural land in upper valleys.

3 To penalize farmers whenever aquatic insects appear in streams.

4 To replace hydrological modeling with informal verbal promises.

4 ライティング（英文要約）

解答は解答用紙（2ページ目）の指定された枠内に英語で書きなさい。（目安語数：60〜70語）

以下の英文を読んで、その内容を英語で要約し、解答欄に記入しなさい。本文にない自分の意見は加えないこと。（目安語数：60〜70語）

Dynamic Pricing at Cultural Institutions

Traditionally, art museums and science centers charged flat admission fees throughout the year, setting one standard ticket price regardless of the day or hour. Recently, however, several major institutions have adopted dynamic pricing, raising ticket prices during peak weekend afternoons and school holidays while offering discounted entry on quiet weekday mornings or late afternoons.

Administrators argue that variable pricing spreads visitor numbers more evenly across the week. Overcrowded galleries become calmer and safer, while extra revenue from peak-hour tourists helps fund building conservation and educational programs. Lower off-peak rates can also attract retirees, students, and flexible local residents.

Critics, on the other hand, warn that higher weekend prices penalize working families who can visit only on Saturdays or Sundays, potentially turning public cultural spaces into luxuries during prime hours. To address this concern, some museums pair dynamic pricing with free monthly family Sundays or reserved low-cost community tickets.

構成メモ・下書き欄（MEMO / PLANNING NOTES — 採点対象外・本番解答は解答用紙へ）

5 ライティング（英作文・意見論述）

解答は解答用紙（2ページ目）の指定された枠内に英語で書きなさい。（目安語数：120〜150語）

次のTOPICについて、あなたの意見とその理由を2つ書きなさい。POINTSから2つを選び、序論・本論（2つ）・結論の構成で論述しなさい。（目安語数：120〜150語）

TOPIC: Should universities require all undergraduate students to complete an internship before graduating?
POINTS:
• Career readiness
• Academic study time
• Financial burden
• Regional inequality
